

In 2003, the sub-department launched a student research club. At the meetings of the club, students present reports on the results of research works.

The main student research fields are as follows:

1. Pharmacological correction of injuries arising from hypoxic, toxic and radiation injuries.
2. The study of new sources of medicinal raw materials of plant and microbial origin, dosage forms and preparations on their basis.
3. Optimization of drug supply for the regional population.

Students' research works are annually presented at a university scientific and technical conference of PSU's students and staff. Students involved in research take part in the program "Participants of the youth research and innovation contest" (U.M.N.I.K). The best student works are published in inter-university collected articles and peer-reviewed journals as well as presented at international, All-Russian and regional conferences.
